

MUTLU ALUMİNIUM MMC COMPANY

The first of these is the fact that the system is not
 self-sufficient. It is dependent on the external world
 for its very existence. It is not a closed system, but
 an open one. It is in constant contact with the
 outside world, and it is through this contact that it
 receives the information it needs to function. This
 information is then processed by the system, and the
 result is a response to the external world. This
 response is then fed back into the system, and the
 process begins again. This is the basic principle of
 the system, and it is the reason why it is so
 effective.

The second of these is the fact that the system is
 not static. It is constantly changing, and it is
 through this change that it is able to adapt to the
 external world. It is not a fixed system, but a
 dynamic one. It is in constant motion, and it is
 through this motion that it is able to maintain its
 equilibrium. This is the basic principle of the
 system, and it is the reason why it is so
 effective.

The third of these is the fact that the system is
 not isolated. It is constantly interacting with the
 external world, and it is through this interaction
 that it is able to maintain its equilibrium. It is
 not a closed system, but an open one. It is in
 constant contact with the outside world, and it is
 through this contact that it receives the information
 it needs to function. This information is then
 processed by the system, and the result is a
 response to the external world. This response is
 then fed back into the system, and the process
 begins again. This is the basic principle of the
 system, and it is the reason why it is so
 effective.

The fourth of these is the fact that the system is
 not self-sufficient. It is dependent on the external
 world for its very existence. It is not a closed
 system, but an open one. It is in constant contact
 with the outside world, and it is through this
 contact that it receives the information it needs to
 function. This information is then processed by the
 system, and the result is a response to the
 external world. This response is then fed back
 into the system, and the process begins again.
 This is the basic principle of the system, and it
 is the reason why it is so effective.

The fifth of these is the fact that the system is
 not static. It is constantly changing, and it is
 through this change that it is able to adapt to the
 external world. It is not a fixed system, but a
 dynamic one. It is in constant motion, and it is
 through this motion that it is able to maintain its
 equilibrium. This is the basic principle of the
 system, and it is the reason why it is so
 effective.

The sixth of these is the fact that the system is
 not isolated. It is constantly interacting with the
 external world, and it is through this interaction
 that it is able to maintain its equilibrium. It is
 not a closed system, but an open one. It is in
 constant contact with the outside world, and it is
 through this contact that it receives the information
 it needs to function. This information is then
 processed by the system, and the result is a
 response to the external world. This response is
 then fed back into the system, and the process
 begins again. This is the basic principle of the
 system, and it is the reason why it is so
 effective.

The seventh of these is the fact that the system
 is not self-sufficient. It is dependent on the
 external world for its very existence. It is not a
 closed system, but an open one. It is in constant
 contact with the outside world, and it is through
 this contact that it receives the information it
 needs to function. This information is then
 processed by the system, and the result is a
 response to the external world. This response is
 then fed back into the system, and the process
 begins again. This is the basic principle of the
 system, and it is the reason why it is so
 effective.

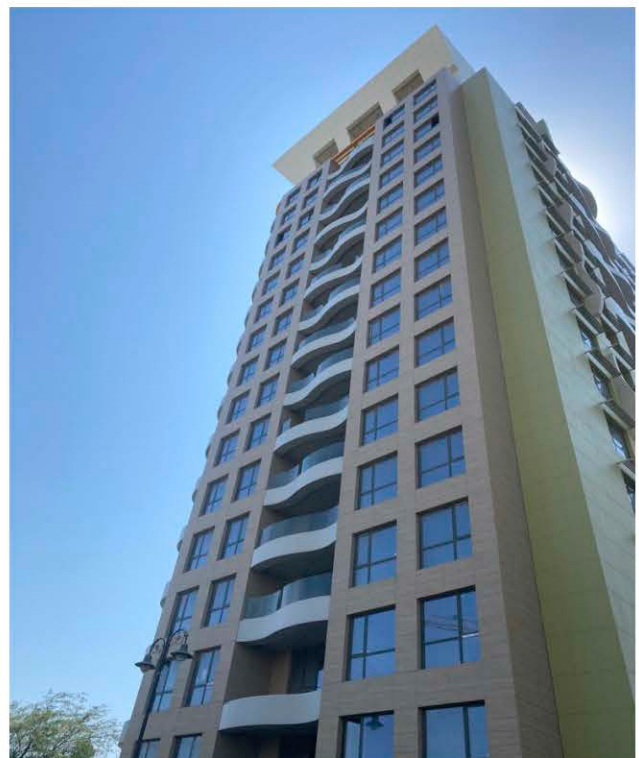

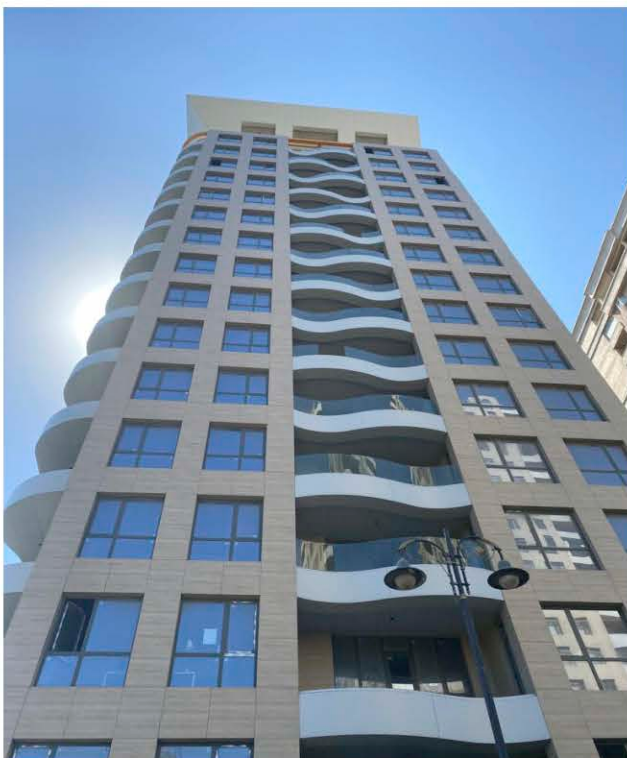

The eighth of these is the fact that the system
 is not static. It is constantly changing, and it is
 through this change that it is able to adapt to the
 external world. It is not a fixed system, but a
 dynamic one. It is in constant motion, and it is
 through this motion that it is able to maintain its
 equilibrium. This is the basic principle of the
 system, and it is the reason why it is so
 effective.

The ninth of these is the fact that the system is
 not isolated. It is constantly interacting with the
 external world, and it is through this interaction
 that it is able to maintain its equilibrium. It is
 not a closed system, but an open one. It is in
 constant contact with the outside world, and it is
 through this contact that it receives the information
 it needs to function. This information is then
 processed by the system, and the result is a
 response to the external world. This response is
 then fed back into the system, and the process
 begins again. This is the basic principle of the
 system, and it is the reason why it is so
 effective.

The tenth of these is the fact that the system is
 not self-sufficient. It is dependent on the
 external world for its very existence. It is not a
 closed system, but an open one. It is in constant
 contact with the outside world, and it is through
 this contact that it receives the information it
 needs to function. This information is then
 processed by the system, and the result is a
 response to the external world. This response is
 then fed back into the system, and the process
 begins again. This is the basic principle of the
 system, and it is the reason why it is so
 effective.
